Slow Water Dispenser Checklist

Match the symptom, do the safe checks, know when to call

Weak Stream

1. **Check the filter date**
   An old filter can clog and cut the flow.
2. **Replace and flush**
   Run short on and off bursts into a sturdy container.

Spitting or Dribbling

1. **Purge trapped air**
   Hold the dispenser in bursts until the stream is steady.
2. **Catch the last drops**
   Pull the glass away slowly after you release the lever.

After a Filter Change

1. **Reseat the filter**
   Make sure it is locked in and sealed.
2. **Test with it removed**
   If water flows freely, the filter was not seated.

Still Slow

1. **Compare with a faucet**
   Low water pressure slows the dispenser too.
2. **Look for a kinked line**
   Unplug the fridge before you move it.
3. **Water on the floor**
   Close the shutoff valve and call a technician.

Still slow? Call Max Appliance Repair Tampa at (813) 906-1062.
